SOLUTIONS

SMART CITY DILEMMAS

- 1. Flexibility, precision, productivity—for whom?
- 2. We don't experience the same city
- 3. Resilient or vulnerable?
- 4. Democratic proximity—or buzz?
- 5. No-one left behind?
- 6. Overview—or surveillance?
- 7. New public spaces without government?
- 8. Is it possible to plan at all?
- 9. Public organization and competences
- 10. Public service 2.0

HEALTHY CITIES JOBS DIGNITY JOBS

WHY CITIES?

Cities are a catalyst for the holistically connected society.

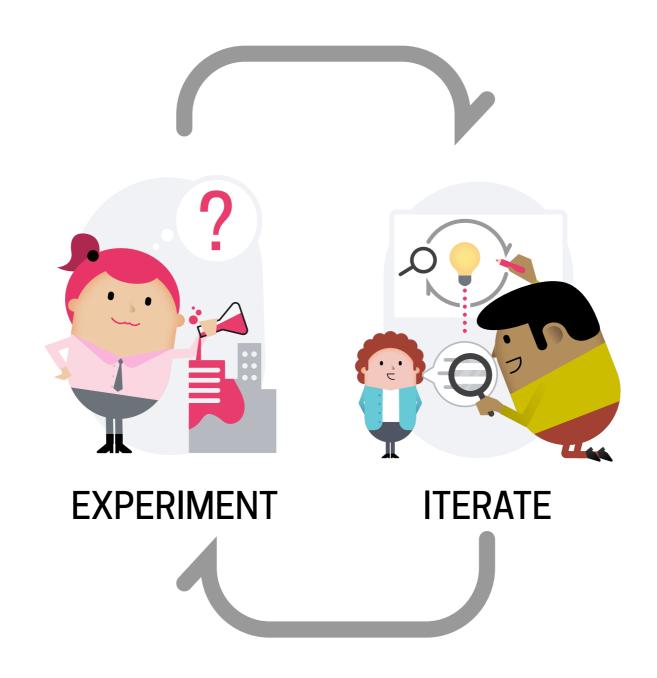

They combine vertical and horizontal logics.

It's a massive meta-market.

Address the gaps most intensely.

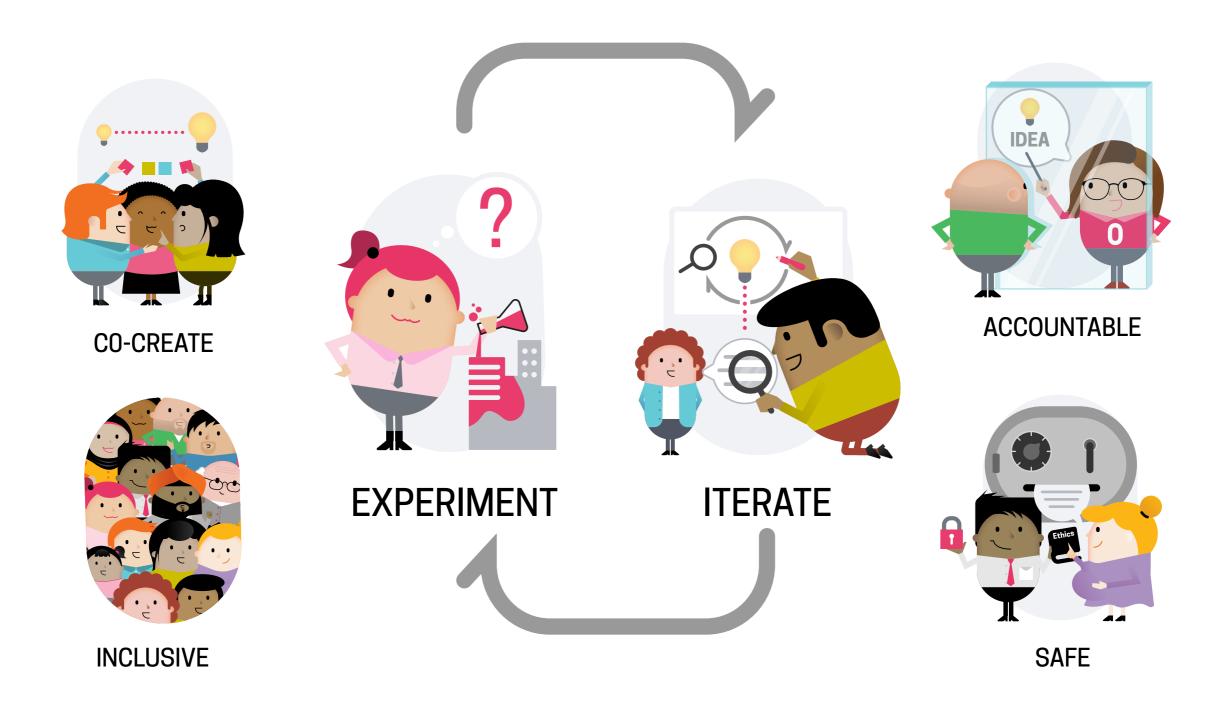

EXPERIMENTATION PROCESS

EXPERIMENTATION PROCESS & VALUES

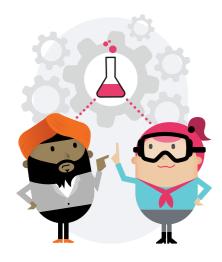

WHAT IS ORGANICITY?

OrganiCity is a service for experimentation that explores how citizens, businesses and city authorities can work together to create digital solutions to urban challenges.

ORGANICITY EXPERIMENTATION AS A SERVICE

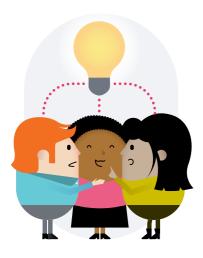

Experimentation management

10 REDUCED INEQUALITIES

- Promoting the development and adoption of IoT technologies for the benefit of humanity, the environment and sustainable development. This includes promoting the research and the use of IoT technologies to address the 17 Sustainable Development Goals adopted by the United Nations and the international community. Governments and policy-makers from developed and developing countries should be encouraged to examine the future challenges and benefits to their economies and accelerate global competitiveness of their economy, region, continent and people by establishing plans and strategies to leverage IoT for SDGs.
- Supporting the implementation of the IoT in urban and rural context to foster the application of ICTs in providing services to build smarter and more sustainable cities and communities. This will allow urban and community stakeholders to take advantage of technological advances and offer new opportunities for quality of life for different strata of society, by promoting accessibility to amenities, technologies and services (including social infrastructure, energy, water and healthcare), and by suppor-

SCORF Smart Cities and Open data REuse

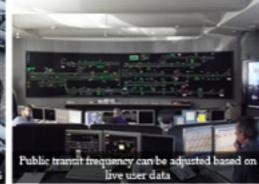

Waste collection can be improved by intelligent

Background

Cities aim to improve the delivery of public services based on innovative software solutions and data sharing.

However, Data has not and will not automati. cally lead to better public service delivery.

To capture that potential, value from data needs to be unlocked by making it inter-operable between departments and organisations.

The shared challenge is how to generate innovative solutions that address common city needs

SCORE aims to increase the efficiency and quality of public service delivery of cities in the sectors of Environment, Waste & Water.

Aim

Parking & Traffic, and Sustainable Mobility by developing innovative open source solutions that use urban data, le. Contributing to Interreg NSR's objective by stimulating "the public sector to generate innovation demand and innovative solutions for improving public service delivery". The solutions will be free to use by other cities, adhere to EU standards, and replicable.

Approach

7 cities from 7 countries in the NSR will be grouped according to their shared challenges. The cities will formulate 6 public service challenges based on their in-depth understanding of the city's operations (business case), the available data (feasibility) and knowledge of their existing programmes and

Each challenge will form a group that will develop 2 open source solutions using urban data. The solutions will be tested in Urban Living Labs. All cities will collaborate throughout the development process to ensure relevance and compatibility. In fact, solutions will be replicated transnationally at least twice within the SCORE project period.

Results

By implementing the innovative open source solutions, SCORE will:

- Reduce by 10% service provision costs of public authorities in the sectors of urban sustainability using open data and open source solutions.
- Improve by 20% the quality of public service provision as valued/assessed by citizens
- Reduce by 30% the software development. time in cities.

Impact

SCORE will solve public service delivery challenges common to partner cities through innovation. This community will contribute to the open-source movement and deliver solutions that are free to use by other NSR cities and beyond.

The partnership will create an ecosystem with cities, research institutions and network organizations for smart public service deliverinnovation. Organisations learn from each other while building solutions, eg in agile software development, transitioning towards BAX being more data-driven.

BARRIERS

- Technology isn't the main problem. Making it relevant for 21st century society at large is a big problem.
- Nobody knows how to formulate requirements, neither demand or supply.
- Professional career paths are unstable.
- Lack of collaboration, both on demand and supply side. Tunnel vision.
- Lack of non-technical competences.
- No (positive) political attention.

WHAT CAN MOVE US FORWARD?

- Large-Scale Pilots
- Relevant, horizontal, holistic specifications
 - fora, processes for pre-standard initiatives
 - -> standards/certification, professional development

OPEN & AGILE SMART CITIES

- Simple interoperability (APIs & semantics)
- Strong demand-side voice. Letting cities provide core input on acceptance (security, ethics & privacy)
- Usability and usefulness (easy experimentation)
- Competences beyond the technical crowd (dissemination isn't enough)
